

Polymath Innovae AI Fellowship

1 year Fellowship Programme | India · United States · Singapore · Dubai

About Polymath Innovae

Who we are

Polymath Innovae is a talent initiative built in partnership with Eonexea AI, bringing together young talent across our global community — India, the US, Singapore, and Dubai — and connecting them to real business work and resources. It runs a community and events platform alongside its flagship offering: a 1 year fellowship programme for future founders and high aspirers.

What we mean by "polymath"

Most campus assessments reward depth in one subject. We are looking for the inverse: students who can hold several unrelated fields in their head at the same time and connect them into something that actually works.

That student usually does not top a single-subject exam. They are the one who read a paper on consumer psychology, remembered it three months later while debugging an onboarding flow, and changed the flow because of it. Those students are hard to find through marks, and they are the ones our partner companies are short of.

The Pathway

Stage	What it is	Who moves on
1. Qualifiers — Polymath Thinking	Pre screening round, open to all registered students	Top performers
2. Polymath Innovae Hackathon	Team build sprint, prize money	Standouts
3. The Fellowship	1 year programme to learn , solve real world problems and get performance based grants and bonus	By invitation and interview

About the Fellowship

The Polymath Innovae Fellowship is a multidimensional training programme for third-year and above students. Fellows work on real, live business problems — including entering the US market — while receiving structured training, mentorship, and grants throughout the programme. It is built for people who want to build: future founders, high aspirers, and those ready to do more than classroom case studies.

What You'll Work On

- Live business problems posed by real teams — not simulated case studies.
- Cross-functional projects spanning Product Thinking, System Design, Product Development & QA, Cybersecurity, and Customer Growth.

- US market entry initiatives, working alongside our global community across India, the US, Singapore, and Dubai.
- Collaborative builds with a cohort of high-aspiring peers, guided by mentors who've built before.

What You'll Get

- Multidimensional training across Product Thinking, System Design, Product Development & QA, Cybersecurity, and Customer Growth.
- Performance based Grants throughout the 1 year programme — real work, real pay.
- A performance-based role with partners on successful completion.
- Sponsored offsites to build alongside your cohort in person.
- Direct mentorship and access to a global builder community.

Who We're Looking For

- Third-year and above students (undergraduate or postgraduate).
- A strong academic record, typically CGPA 8+ or equivalent.
- Demonstrated curiosity across a diverse array of topics, with the ability to connect ideas across domains — "Polymath Thinking."
- Systems thinking: the ability to break down complex problems, identify stakeholders, and design end-to-end workflows.
- A bias toward building — prior hackathon, project, or founder-adjacent experience is a strong plus, though not mandatory.
- Clear communication skills and comfort presenting ideas to a founding-team audience.

Programme Details

- Duration: 1 year
- Format: Live projects, structured training modules, mentorship, and in-person offsites
- Locations: India, United States, Singapore, Dubai (community-wide; project allocation may vary)
- Compensation: Paid throughout the programme, with a performance-based full-time role on completion

How to Apply

Interested candidates can register their interest through the Polymath Innovae platform. Shortlisted candidates may be invited to complete a screening assignment as part of the selection process before final fellowship offers are made.

Polymath Thinking — The Qualifiers round

What it vets

Eight dimensions. The first one carries the most weight — the other eight are the raw material it operates on.

1. Cross-domain curiosity and synthesis Does the student read widely outside their syllabus, and can they connect two unrelated things into a third idea that holds up? Assessed through open prompts that require joining fields, not recalling one.

2. AI Working literacy, not research depth. What models can and cannot do, where they fail, where it is the wrong tool.

3. Systems thinking and workflows Can they see a process as a system — inputs, dependencies, failure points, feedback loops — and find where it actually breaks?

4. Product Starting from the user and the outcome. Judgement about what to build and what to leave out.

5. Software architecture How components fit together and hold up as they scale. Structural reasoning, not framework trivia.

6. Cybersecurity Understanding how things break and how they are defended. Adversarial instinct.

7. Applied consumer psychology Why people behave the way they do in a product, and how that translates into design and messaging decisions.

8. Marketing, sales and customer success How something reaches the person who needs it, and how that relationship is kept.

How it is scored

No student is expected to be strong in all nine. We are not looking for nine specialists in one body; we are looking for range and the ability to connect.
